down to 4×4 blocks. It can thus achieve a high efficiency. VP9 supports 10 intra-prediction modes and four inter-prediction modes.

AN OVERVIEW OF EMERGING VIDEO CODING

When the blocks have finite length, to enable block-by-block channel estimation and symbol decoding, we need to remove IBI. As shown in Fig. 1, we achieve this by postprocessing by a matrix to obtain ibi . There are two prevalent and easy-to-implement guard options for IBI elimination: ZP and CP guards, each requiring a specific pair.

The proportion of the requirements for each part is 70% for Embedded Block Coding with Optimized Truncation (EBCOT), 20% for wavelet transformation and the remaining 10% for all the other calculations [1].

1. Introduction

An image decoding method for decoding, on a block-by-block basis, image data included in a coded bitstream includes: obtaining a fixed number of merging candidates each of which is a candidate set of a prediction direction, a motion vector, and a reference picture index which are to be referenced
