DNA is a double-stranded molecule, while RNA is a single-stranded molecule. DNA is stable under alkaline conditions, while RNA is not stable. DNA and RNA perform different functions in humans. DNA is responsible for storing and transferring genetic information, while RNA directly codes for amino acids and acts as a messenger between DNA and ribosomes to make proteins.

Abstract DNA and RNA samples from blood are the common examination target for non-invasive physical tests and/or biomedical studies. Since high-quality DNA and RNA samples guarantee the correctness of these tests and/or studies, we investigated the effects of storage temperature and storage duration of whole blood on DNA and RNA qualities.

Currently, the use of synthetic DNA or RNA is an integral part of most biological research, either directly (PCR, sequencing, site-directed mutagenesis, redesigning genes and gene control regions, gene expression profiling on microarrays, etc.) or indirectly (for example, in research focused on genome sequences that were derived through the use of synthetic DNA).
