Basics of Heat Transfer. In the simplest of terms, the discipline of heat transfer is concerned with only two things: temperature, and the flow of heat. Temperature represents the amount of thermal energy available, whereas heat flow represents the movement of thermal energy from place to place. On a microscopic scale, thermal energy is related to the kinetic energy of molecules.

~~Introduction to the Principles of Heat Transfer~~

PRINCIPLES OF HEAT TRANSFER was first published in 1959, and since then it has grown to be considered a classic within the field, setting the standards for coverage and organization within all other Heat Transfer texts. The book is designed for a one-semester course in heat transfer at the junior or senior level, however, flexibility in ...

Principles of Heat Transfer Heat is transferred to and from objects -- such as you and your home -- via three processes: conduction, radiation, and convection. Conduction is heat traveling through a solid material. On hot days, heat is conducted into your home through the roof, walls, and windows.

~~Principles of Heating and Cooling | Department of Energy~~

The Second Law of Thermodynamics states that heat transfers from an object of a higher temperature to that of a lower temperature. The higher energy atoms (and thus higher temperature) move toward the lower energy atoms (lower temperature) in order to maintain equilibrium (known as thermal equilibrium). Heat transfer occurs in order to maintain this principle when an object is at a different temperature from another object or its surroundings.

Thermodynamics is applicable to systems that are in thermal equilibrium. The phenomenon of heat transfer deals with systems that are not in thermal equilibrium. Heat transfer analyzes the rate of transfer of heat. Temperature difference or temperature gradient between the systems in consideration is a prerequisite for heat transfer.

~~Conduction, Convection, and Radiation - 3 Modes of Heat ...~~

Heat is transferred by three methods: conduction, convection, and radiation. Conduction requires the physical contact of two objects. In the case of a wall, heat is con- ducted through the layers within the wall from the warmer side to the cooler side. Convection. is heat transfer due to fluid or airflow.
